knowledge makes the difference

**ERIKS**  
Seals and Plastics

## ABOUT ERIKS

ERIKS is an international industrial service provider offering a wide range of high-quality mechanical engineering components and associated technical and logistics services, primarily related to elastomer and engineered plastic components used in critical applications and environments. Our passion for technology has helped transform virtually every market in which we operate.

Vast market knowledge, in combination with strong customer relationships, keeps ERIKS on the forefront of your industry's needs. With a diverse and experienced technical staff ERIKS can aid in product selection as well as product development. Our goal is to partner with our customers and help them develop innovative and sustainable solutions, and cut costs through technology, operations excellence and a strong customer focus.

### Knowledgeable

*We offer reliable and knowledgeable recommendations that go far beyond the basic product level for a variety of applications utilizing a wide selection of materials.*

### Innovative

*If we cannot find the right product for your application we will work with you to create it.*

### Unbiased

*Our dedication and application knowledge allows us to be your sealing partner, not just a supplier.*

### Responsive

*Our commitment is to provide quick and accurate information on parts and materials and delivery when you need them.*

### OEM Original Equipment Manufacturers

- » Contribution to R&D
- » Components and sub-assemblies
- » Quality assurance
- » Procurement and logistics

### MRO Maintenance Repair Overhaul

- » Application, product and material knowledge
- » Lower total costs
- » Broad logistical services
- » Performance improvements

## MARKET KNOWLEDGE

Whatever market you are in, ERIKS has the knowledge and experience to understand and focus on your specific needs and deliver tailored solutions that can lower your operating costs and save you valuable time.

Not only do we know and understand your industry, but - thanks to our comprehensive coverage of a broad range of manufacturing and other industrial disciplines - we can apply relevant lessons learned elsewhere to your particular field: bringing you benefits of transferable technology unavailable from any other industrial services provider.

## THE SPRING ENERGIZED CONCEPT

Spring energized seals are designed to be used in a wide range of applications and provide improved sealing performance where conventional seals may fail such as high/low speeds, wide temperature ranges and/or contact with corrosive media.

While ERIKS does offer standard sizes that can be direct replacements to many standard seals, we understand that not all applications are the same and the one size fits all approach does not always deliver the level of improvement that is desired. Working directly with our engineering team and sealing specialists we can design and manufacture the right solution for your requirements.

The purpose of this design guide is to assist you in understanding the concept and design considerations when considering the use of a spring energized seal for your application. For more information, or to schedule a design consultation complete the *Technical Action Request* at the end of this guide, or contact the ERIKS location nearest you.

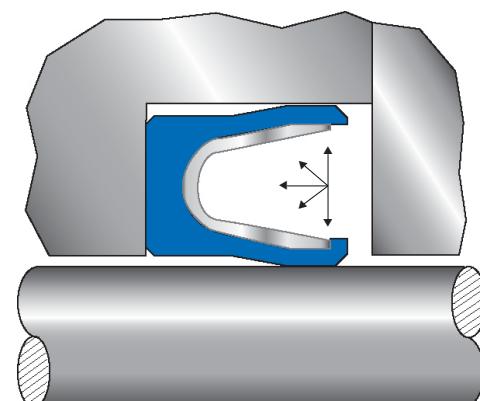

Fig. 1

**Figure 1** represents a low-pressure sealing situation where the system pressure alone does not provide enough force to seal. The spring in this situation provides the necessary sealing force. Below approximately 100 psi the spring energizer supplies the internal force to create a positive seal.

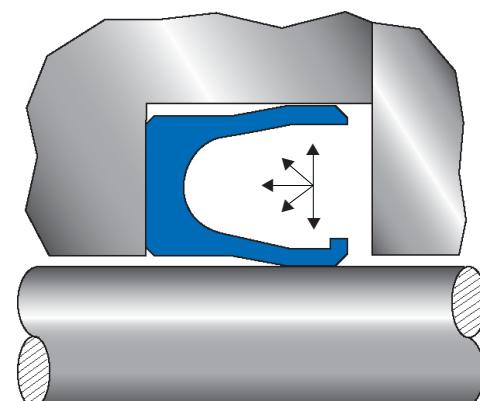

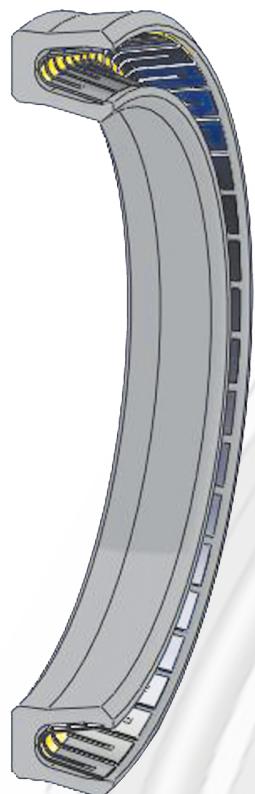

Fig. 2

**Figure 2** represents a higher pressure application where system pressure is sufficient to create a positive seal. This threshold occurs at approximately 100 psi allowing system pressure to take over and provide the sealing force.

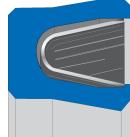

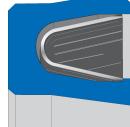

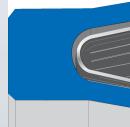

## AVAILABLE JACKET MATERIALS\*

Material Code	Description	Typical Applications	Temperature Range	Coefficient of Friction
E400	Virgin PTFE Color: White	An FDA compliant, light duty material. Good in light gases and cryogenic service.	-400 to +450	.05 / .08
E471	Graphite Filled PTFE Color: Black	The graphite filler in this blend acts as a dry lubricant making it a good choice in dry running services.	-320 to +475	.06 / .10
E431	Glass/Moly Filled PTFE Color: Dark Gray	A highly wear resistant blend good for high speed applications on hardened shafts.	-250 to +550	.06 / .10
E462	Carbon/Graphite Filled PTFE Color: Dark Gray	A good material choice for combinations of speed and temperature.	-320 to +475	.08 / .12
E491	Ekonol Filled PTFE Color: Beige	This blend uses a non-abrasive polymer filler. Best in dynamic applications running against soft metals.	-200 to +550	.08 / .12
E282Z	Carbon/Graphite/PPS Filled PTFE Color: Black	Heavy duty material reserved for the most difficult combinations of temperature, speed and pressure.	-200 to +550	.08 / .12
E220	Thermoplastic Elastomer Color: Black	When corrosion resistance and temperature extremes are not the primary concerns TPE is a good choice for tight sealing.	-80 to +275	.30 / .60
E010	UHMW-PE Color: Translucent White	An FDA compliant material with very good wear resistance.	-320 to +200	.15 / .25
E020	Acetal Color: Brown	As a backup ring this material has good extrusion resistance with low water absorption.	-70 to +250	.30 / .40
E125	PEEK Color: Tan	A high-modulus, engineered plastic with excellent thermal and mechanical properties.	-100 to +550	.35 / .45

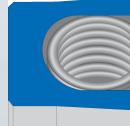

\*Not all materials shown. Consult factory for additional materials.

## CANTILEVER SPRING SEALS

Section View	Description	Part #	Pressure Rating	Application
Code*				
	Standard Lip Standard Heel	EV1A EV2A	3,000 psig	A good general purpose solution. The EV1A and EV2A series are designed for slow to moderate speeds over a wide temperature and pressure range.
	I.D. Scraper Standard Heel	EV1B EV2B	3,000 psig	Used in reciprocating rod applications with viscous fluids. The scraper lip can also be used to "snap" the seal into stepped glands.
	O.D. Scraper Standard Heel	EV1C EV2C	3,000 psig	Used in reciprocating piston applications with viscous fluids. The scraper lip can also be used to "snap" the seal into stepped glands.
	Double Scraper Standard Heel	EV1D EV2D	3,000 psig	Good for the combination of a stepped gland and reciprocating motion.
	Standard Lip Extended Heel	EV3A EV4A	10,000 psig	Same as EV1A and EV2A series but with greater pressure capabilities.
	I.D. Scraper Extended Heel	EV3B EV4B	10,000 psig	Same as EV1B and EV2B series but with greater pressure capabilities.
	O.D. Scraper Extended Heel	EV3C EV4C	10,000 psig	Same as EV1C and EV2C series but with greater pressure capabilities.
	Double Scraper Extended Heel	EV3D EV4D	10,000 psig	Same as EV1D and EV2D series but with greater pressure capabilities.
	Internal Face Seal	EV5A	3,000 psig	An excellent alternative to elastomers in applications with difficult combinations of temperature and pressure and little to no motion. The EV5A seals pressure from an internal source.
	External Face Seal	EV6A	3,000 psig	An excellent alternative to elastomers in applications with difficult combinations of temperature and pressure and little to no motion. The EV6A seals pressure from an external source.

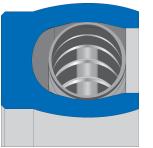

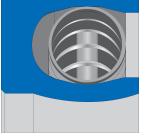

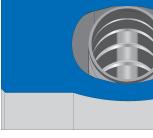

\*For full part number description see pg. 12

## SPIRAL PITCH SPRING SEALS

Section View	Description	Part #	Pressure Rating	Application
Code*				
	Standard Lip Standard Heel	ES1A ES2A	3,000 psig	The ES1A and ES2A series are designed for higher speed applications where a constant spring force is of benefit. Temperatures are limited to 300° F.
	I.D. Scraper Standard Heel	ES1B ES2B	3,000 psig	Used in reciprocating rod applications with viscous fluids. The scraper lip can also be used to "snap" the seal into stepped glands.
	O.D. Scraper Standard Heel	ES1C ES2C	3,000 psig	Used in reciprocating piston applications with viscous fluids. The scraper lip can also be used to "snap" the seal into stepped glands.
	Double Scraper Standard Heel	ES1D ES2D	3,000 psig	Good for the combination of a stepped gland and reciprocating motion.
	Standard Lip Extended Heel	ES3A ES4A	10,000 psig	Same as ES1A and ES2A series but with greater pressure capabilities.
	I.D. Scraper Extended Heel	ES3B ES4B	10,000 psig	Same as ES1B and ES2B series but with greater pressure capabilities.
	O.D. Scraper Extended Heel	ES3C ES4C	10,000 psig	Same as ES1C and ES2C series but with greater pressure capabilities.
	Double Scraper Extended Heel	ES3D ES4D	10,000 psig	Same as ES1D and ES2D series but with greater pressure capabilities.
	Internal Face Seal	ES5A	3,000 psig	An excellent alternative to elastomers in applications with difficult combinations of temperature, pressure and speed. The ES5A seals pressure from an internal source.
	External Face Seal	ES6A	3,000 psig	An excellent alternative to elastomers in applications with difficult combinations of temperature, pressure and speed. The ES6A seals pressure from an external source.

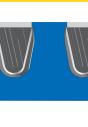

\*For full part number description see pg. 12

## HELICAL SPRING SEALS

Section View	Description	Part #	Pressure Rating	Application
Code*				
	Standard Lip Standard Heel	EH1A EH2A	3,000 psig	The EH1A and EH2A series are best suited for very slow or static applications where tight sealing in light fluids and gases is important. Also a very good choice for low pressure applications.
	I.D. Scraper Standard Heel	EH1B EH2B	3,000 psig	Used in reciprocating rod applications with viscous fluids. The scraper lip can also be used to "snap" the seal into stepped glands.
	O.D. Scraper Standard Heel	EH1C EH2C	3,000 psig	Used in reciprocating piston applications with viscous fluids. The scraper lip can also be used to "snap" the seal into stepped glands.
	Double Scraper Standard Heel	EH1D EH2D	3,000 psig	Good for the combination of a stepped gland and reciprocating motion.
	Standard Lip Extended Heel	EH3A EH4A	10,000 psig	Same as EH1A and EH2A series but with greater pressure capabilities.
	I.D. Scraper Extended Heel	EH3B EH4B	10,000 psig	Same as EH1B and EH2B series but with greater pressure capabilities.
	O.D. Scraper Extended Heel	EH3C EH4C	10,000 psig	Same as EH1C and EH2C series but with greater pressure capabilities.
	Double Scraper Extended Heel	EH3D EH4D	10,000 psig	Same as EH1D and EH2D series but with greater pressure capabilities.
	Internal Face Seal	EH5A	3,000 psig	An excellent alternative to elastomers in applications with difficult combinations of temperature and pressure and little to no motion. The EH5A series seals pressure from an internal source.
	External Face Seal	EH6A	3,000 psig	An excellent alternative to elastomers in applications with difficult combinations of temperature and pressure and little to no motion. The EH6A series seals pressure from an external source.

\*For full part number description see pg. 12

## SPECIAL CONFIGURATIONS\*

Section View	Description	Product Code	Pressure Rating	Application
	High-Speed Rotary Lip Seal	EX7	250 psig	The EX7 series is a low cost, all polymer lip seal. There is no spring energizer as the sealing lip is formed instead of machined yielding low contact forces and running friction.
	Single Contact Anti-Rotation Seal	EV8	3,000 psig	The EV8 series uses a standard cantilever spring loaded U-cup for the I.D. seal but on the O.D. an O-ring is used for the static seal and the anti-rotation mechanism.
	Single Contact Anti-Rotation Seal	ES8	3,000 psig	Similar to the EV8 series but with a spiral pitch spring instead of a cantilever spring. Constant spring force and greater dimensional variances can be handled with this configuration.
	Double Contact Anti-Rotation Seal	EV9	2,000 psig	Similar to the EV8 series but with a contacting lip on both the O.D. and the I.D. as well as an O-ring for anti-rotation. A good choice for smaller cross sections.
	Double Contact Anti-Rotation Seal	ES9	2,000 psig	Same configuration as the EV9 but with spiral pitch spring instead of cantilever spring. The ES9 can handle higher speeds and greater dimensional variances.
	Silicone Filled Spring Groove	EVS	Up to 10,000 psig	Used primarily in food and drug applications, silicone fills the spring cavity to prevent entrapment of biological contaminants. Also effective for preventing the seal groove from becoming packed with viscous or solidifying fluids. Only available with cantilever spring.
	Tandem Springs	EXT	Up to 10,000 psig	By dividing the seal into two separate seal cavities, much larger hardware cross sections can be accommodated. Available in all three spring types.
	Nested Springs	EVN	Up to 10,000 psig	By placing one spring inside another (nesting) greater spring force can be established. This configuration is especially effective in cryogenic services or applications where a high unit load is required. Available with cantilever spring only.
	O-Ring Energizers	EXO	Up to 10,000 psig	For applications that require no metal contact with the process fluid an O-ring energizer can be used. Energizers are available in most elastomeric materials to suit the application.
	Flanged Rotary Seal	EXF	Up to 3,000 psig	An anti-rotation design for high-speed rotary applications. Special hardware design modifications are required. Consult factory for specifics. Available with cantilever and spiral pitch springs.
	Backup Rings	EBR	Up to 30,000 psig	For use in extreme pressure situations or when the extrusion gap is larger than recommended. Backup rings can be configured several different ways to suit an application. Consult the factory for specifications.

\*Special configurations are not available as standard dash numbers. Contact factory for sizing.

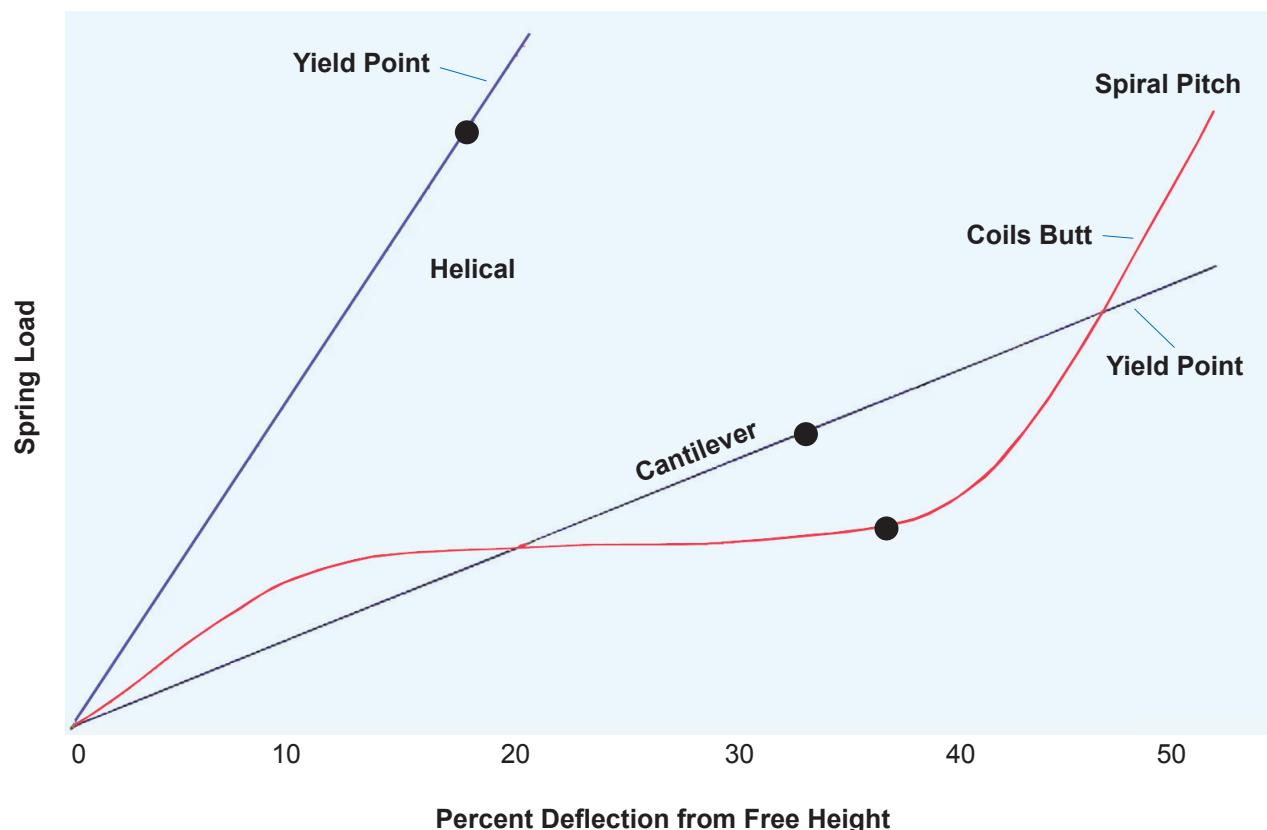

## SPRING SELECTION

When considering a spring energized seal, the spring choice can be very important. Through the spring the seal can be "fine tuned" for each individual application. For example, if an application requires tight sealing of light gases in a static environment then the helical spring may be a good choice.

Likewise, if an application requires constant force over the useable life of the seal in a dynamic environment then perhaps the spiral pitch spring is the right choice. Once the spring type is selected, in some cases there is additional variability with the spring load.

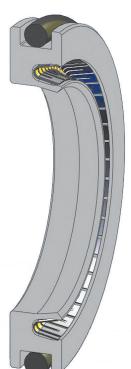

The graph below describes typical loading forces of the three different spring types. Please consult the factory for specific spring forces per series.

### Typical Load vs. Deflection Curves\*

● = load point for each spring type.

**Cantilever** spring, commonly referred to as V-spring or finger spring has a shallow but linearly rising load curve. As a result force will decrease as the seal wears. The load curve for the **Spiral Pitch** spring is non-linear which allows the force to remain constant over the life of the seal. **Helical** spring is also linearly rising but at a much steeper slope. This means that force falls off rapidly with seal wear but high until loading is achievable in the static state.

\*Graph not necessarily representative of any one spring.

	H=Helical				H=Heavy		

## DESIGN CONSIDERATIONS

### Surface Finish

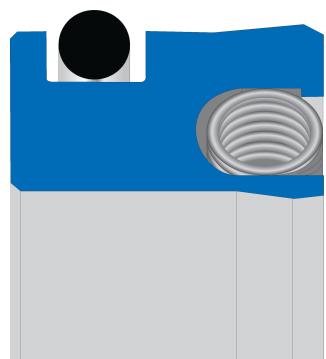

One of the most important factors for seal performance is surface finish. This is certainly true for conventional elastomers but it is critical for PTFE spring energized seals. Though an improper finish may not cause complete seal failure, it is likely to yield inconsistent performance from one assembly to the next. The required surface finish is also a result of the media being sealed. Figure 3 lists general guidelines for surface finish with respect to spring energized seals.

### Recommended Surface Finish

Media to Seal	Dynamic Surface	Static Surface
Cryogenics (Helium, Hydrogen)	2-8 $\mu$ inch RMS	8-12 $\mu$ inch RMS
Gases (Air, Nitrogen, Oxygen, Natural Gas, etc.)	6-12 $\mu$ inch RMS	12-20 $\mu$ inch RMS
Liquids (Hydraulic Fluid, Water, Crude Oil)	8-16 $\mu$ inch RMS	16-32 $\mu$ inch RMS

Fig. 3

### Surface Hardness

Equally important to surface finish with PTFE spring energized seals is surface hardness, particularly in dynamic applications. Over time a highly filled PTFE blend can wear a groove into as-machined stainless steel at the point of contact. Once this occurs, leakage is eminent and motion within the working system can be obstructed. Figure 4 gives general recommendations for surface hardness with respect to application speed and pressure.

### Recommended Hardness Values

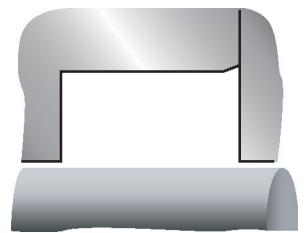

Type of Motion	Surface Speed (sfpm)	Hardness Rockwell C				
		0 psi	150	500	1000	5000+
Reciprocating	Up to 100	30	30	35	40	50
	100 and Over	44	44	48	50	60
Rotary	Up to 150	44	50	55	70	70+
	150 to 500	60	65	70	70+	*
	500 to 2500+	65	70	70+	*	*

### Gland Options

Because PTFE does not act like a conventional elastomer, special consideration must be taken when designing the seal gland. Earlier in this catalog surface finish and hardness were discussed. The third critical aspect to a successful ERIKS SE sealing solution is gland geometry.

#### Split Gland

Ideally for SE products a split or 2-piece gland is desirable. This configuration allows for easy installation of any type of seal. When a split gland is not practical, one of the following options can be employed.

#### Stepped Gland

Stepped glands can be used with either rod or piston seals. A scraper lip on the seal is recommended for retaining the seal.

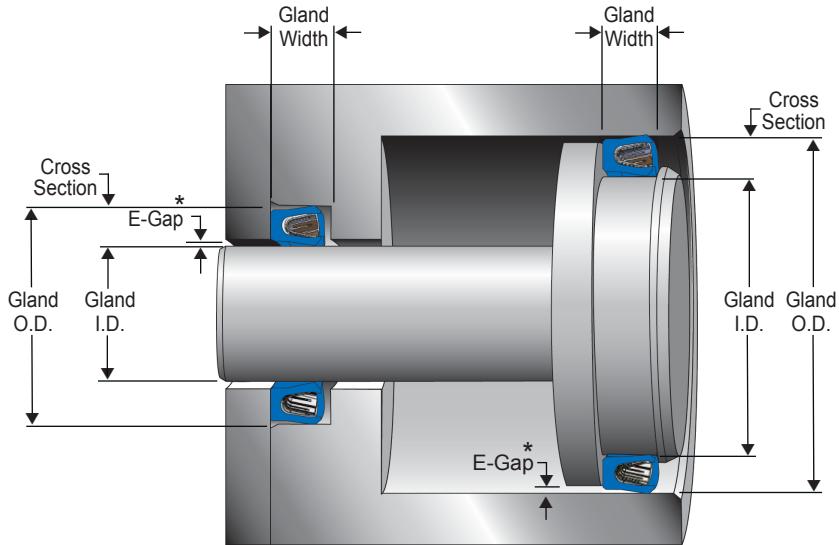

#### Solid Gland

Though it is possible to install an ERIKS SE seal into a solid gland, certain size restrictions apply. Contact the factory for solid gland limitations.

## TROUBLESHOOTING GUIDE

	Normal Wear	Normal Wear High Pressure	Yielded Spring or Poor Weld	Misalignment or Runout	Improper Support of Seal	Rough Mating Surfaces	Improper Surface Hardness	System Pressure Too High	Machining or Handling Issue	Chemical Compatibility	Installation Damage
